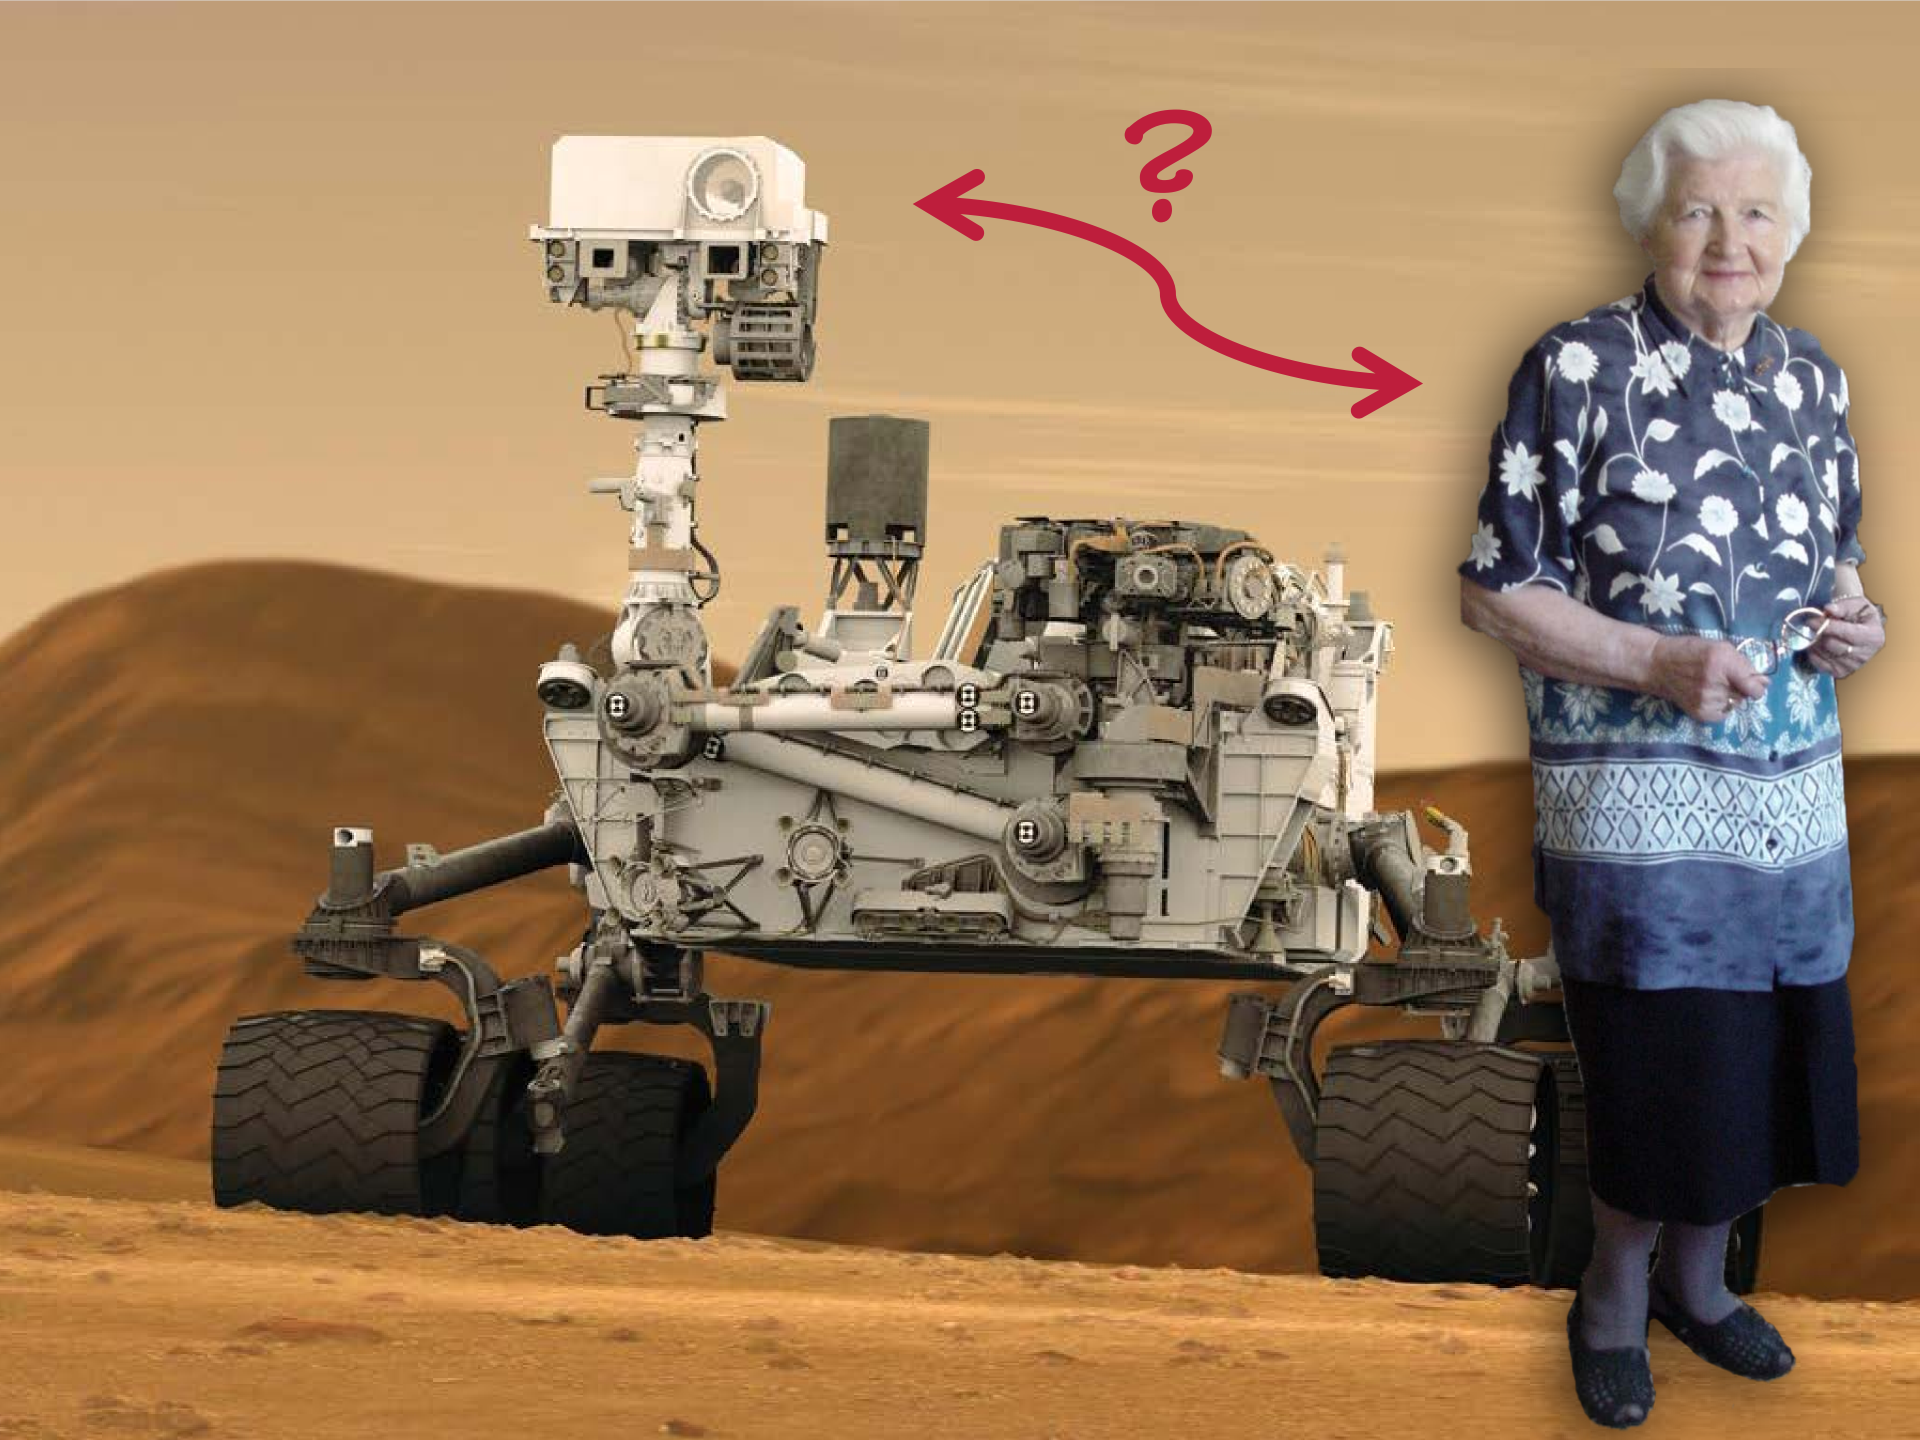
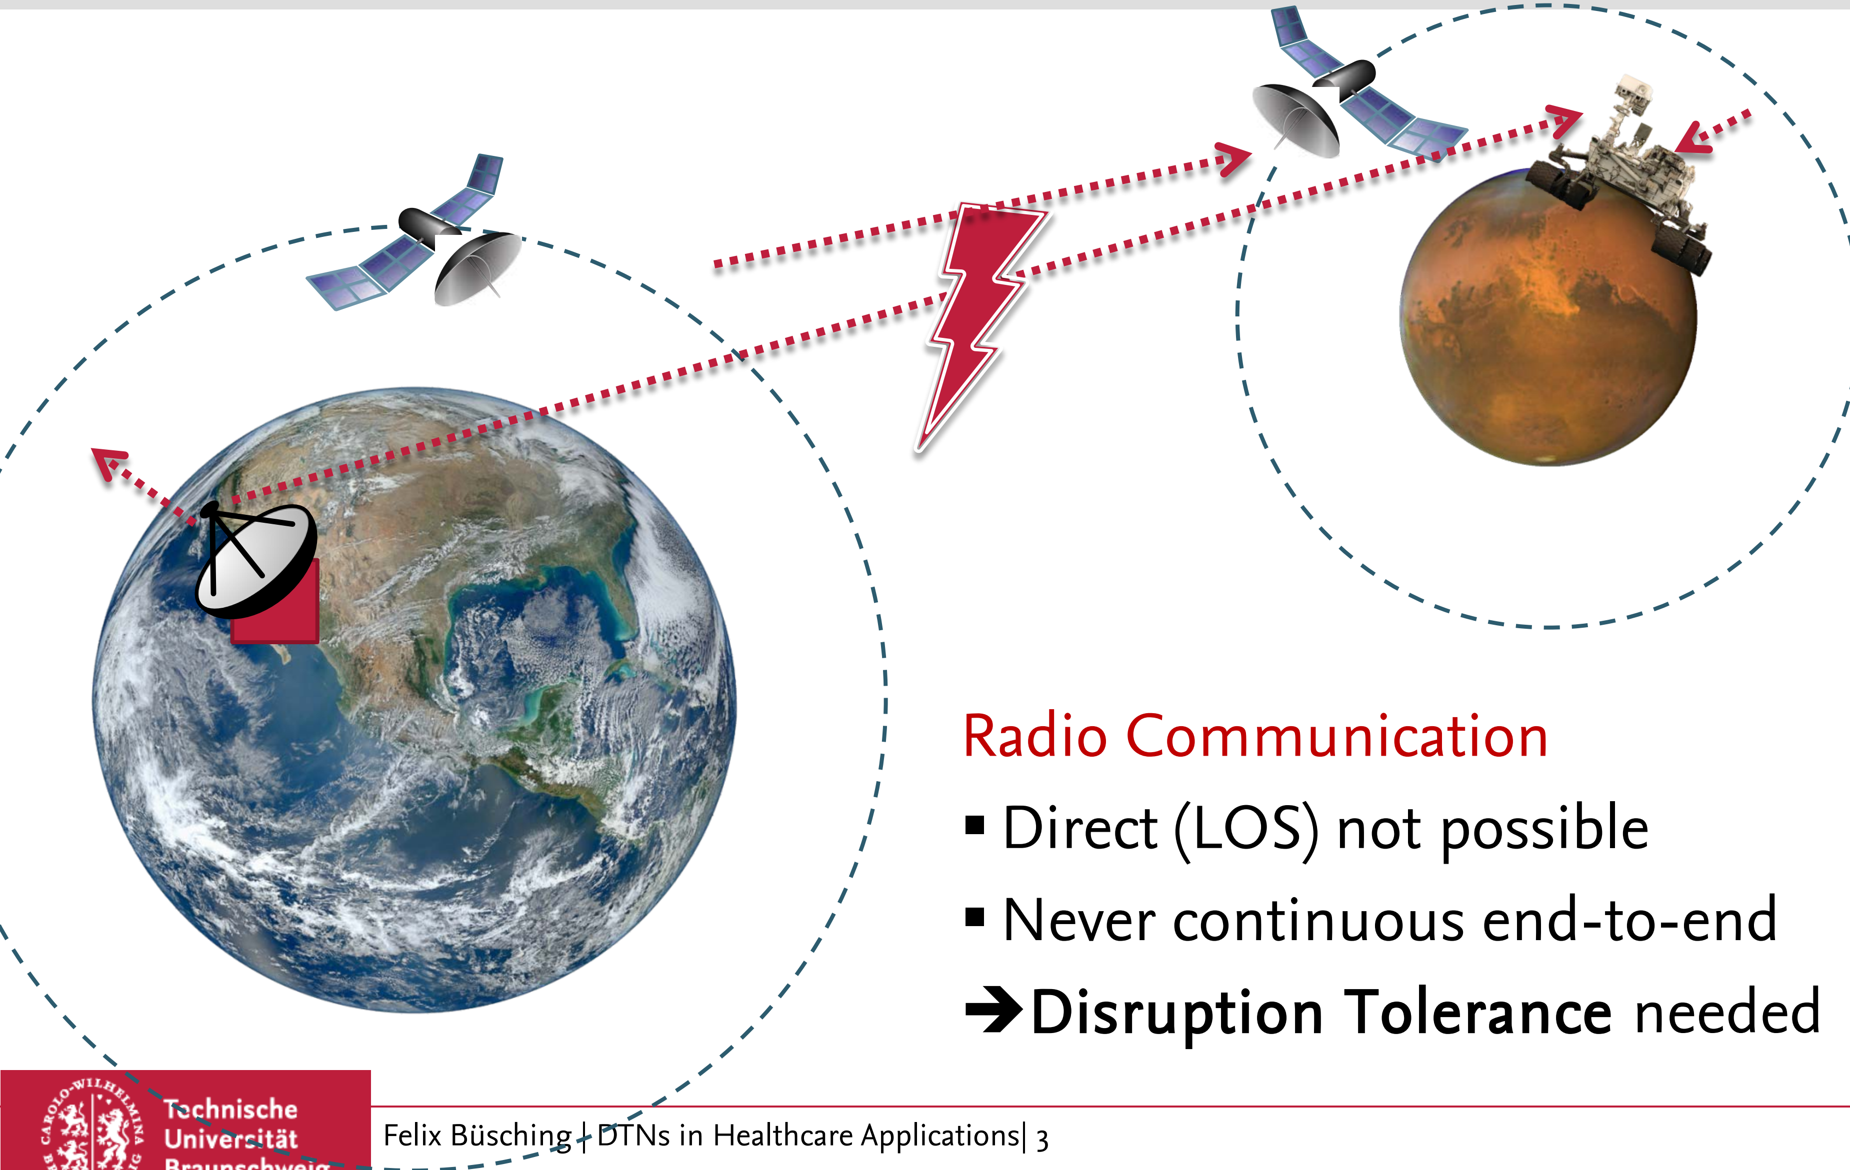
DTNs* in Healthcare Applications

Felix Büsching, Lars Wolf

* DTNs = Delay/Disruption Tolerant Networks (Unterbrechungstolerante Netzwerke)



Interstellar Communication

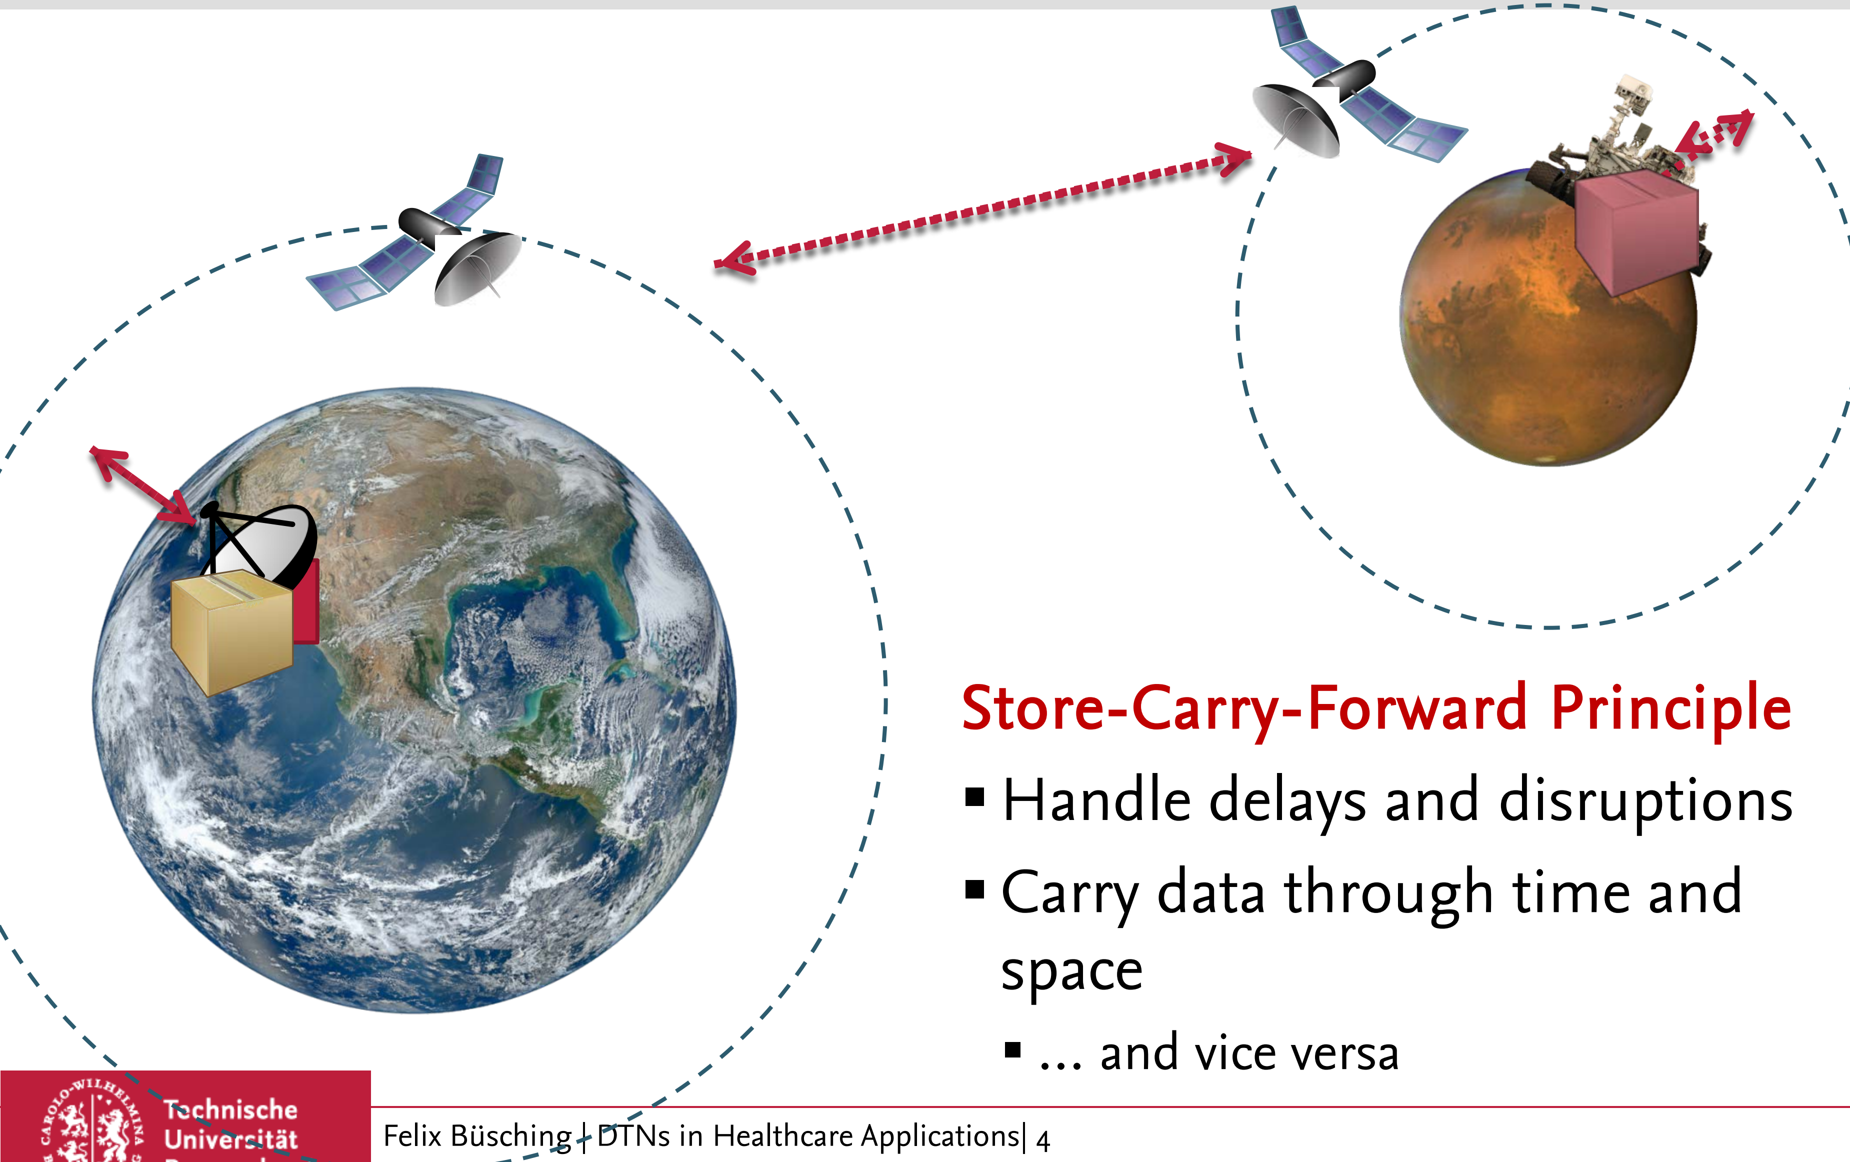


Radio Communication

- Direct (LOS) not possible
- Never continuous end-to-end

→ **Disruption Tolerance** needed

Disruption Tolerant Networks (DTN)



Store-Carry-Forward Principle

- Handle delays and disruptions
- Carry data through time and space
  - … and vice versa

CURIOSITY

Summary: Interstellar Communication – e.g. Mars Rover "Curiosity"

Aim

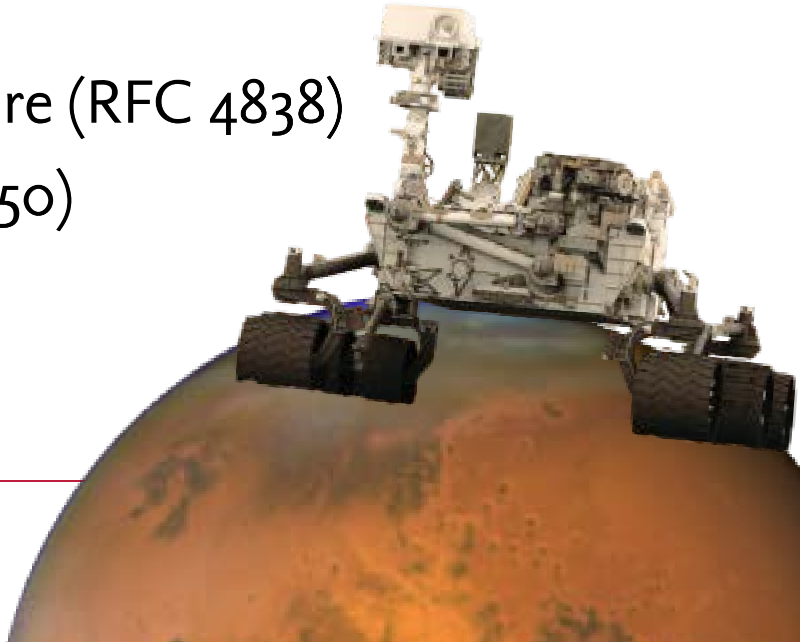
- Collect data, transfer it to earth

Challenges

- Harsh environment
- Huge delays
- No continuous end-to-end connection

Solutions: Store – Carry – Forward

- Delay-Tolerant Networking Architecture (RFC 4838)
- Bundle Protocol Specification (RFC 5050)



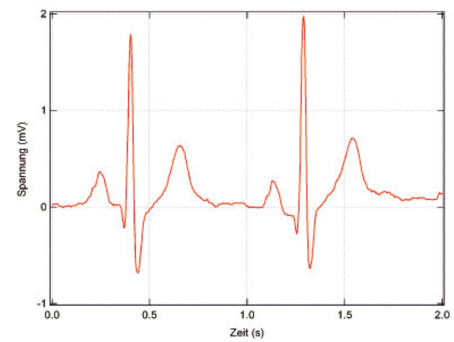
DTNs in Healthcare Applications

- What is a DTN?
- How do DTNs work?
- Data Acquisition and Transmission in Long Term Monitoring
- Sensors and Data Rates
- Opportunity for DTNs?!

Monitoring Systems in Healthcare and AAL

Sensors for vital parameters

- ECG
- Blood pressure
- Acceleration
- Temperature, Air Pressure



Long term monitoring – today

- Data is either
  - Stored on memory card or
  - Transmitted wirelessly to base station

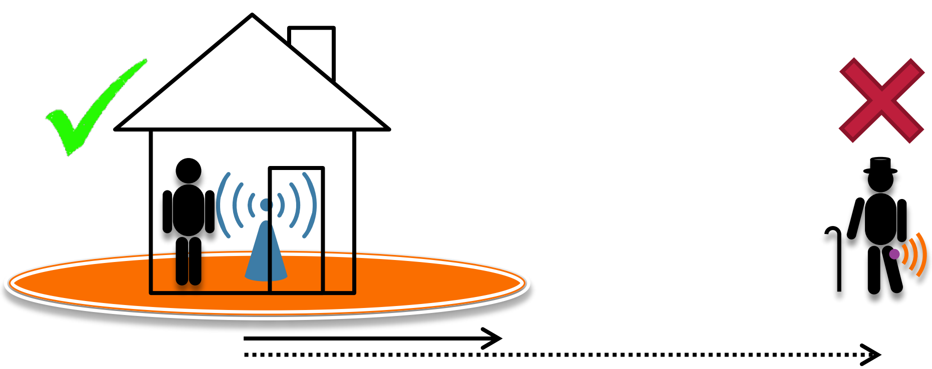
Drawbacks of Local Storage and Wireless Transmission

Local Storage (Body Device)

- Robust, but
  - Limited capacity
  - Interaction required (exchange cards)
  - No remote configuration possible

Constant Wireless Transmission to Sink

- Comfortable
  - Data available in “realtime”
  - Remote configuration, but
- Unstable links
- Data loss



Summary: Wireless Monitoring in Health Care

Aim

- Collect data, … , transfer it somehow to physician

Challenges

- Harsh environment (elderly)
- Huge delays
- Often disrupted connection

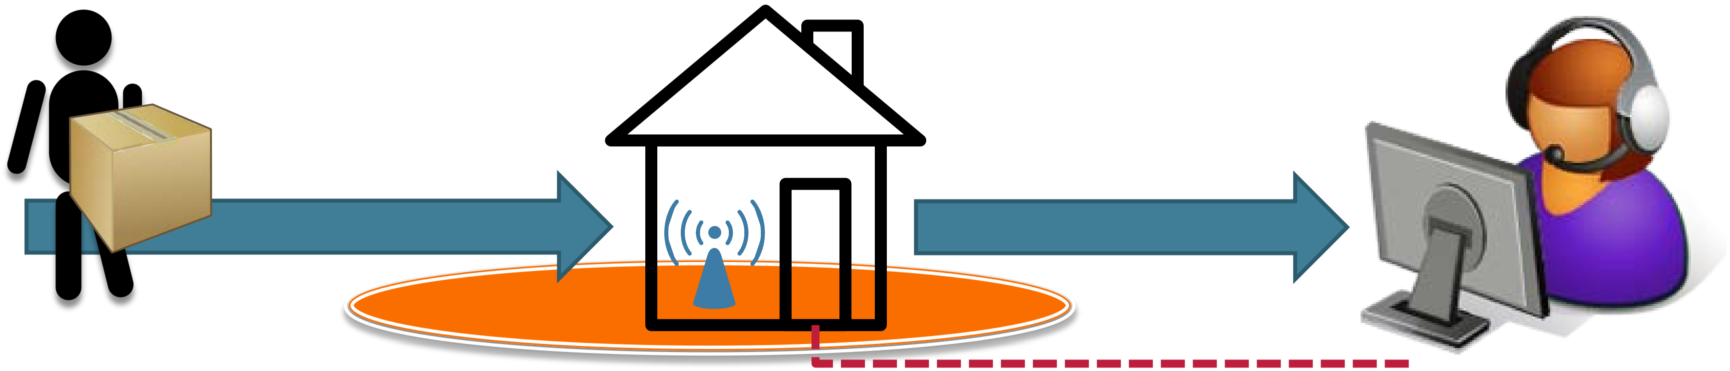
Solutions

- Look up!

Opportunity for DTN techniques

Adopt “Store – Carry – Forward” Principle

- Store – while “on the road”
- Carry – data home
- Forward – to base station at home

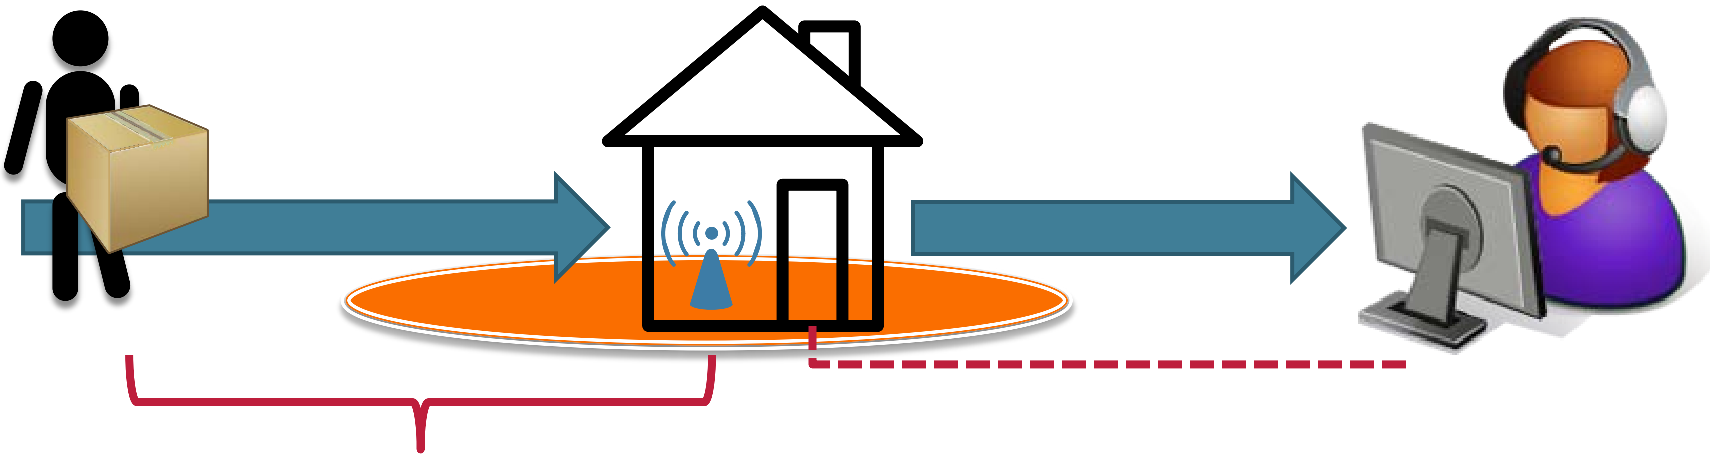


Implicit Synchronization

- No data get’s lost
- Seamless handover from “online” to “offline”

Person

- Generator data rate, D_{gen}
- Stored data capacity, S_{fill}



Network

- Transmission throughput, goodput, D_{good}

→ $D_{gen} < D_{good}$

Generated Data: Expected Data Rates

Typical Sensors

Sensor	D_{min}	D_{max}	D_{typ}	Configuration f. D_{typ}
Accelerometer	3 Bit/s	124 800 Bit/s	**1 500 Bit/s**	10 Bit, 50 Hz, 3 axis
Gyroscope	4 800 Bit/s	38 400 Bit/s	**9 600 Bit/s**	16 Bit, 200 Hz, 3 axis
Air Pressure + Temp.	35 Bit/s	4 392 Bit/s	**70 Bit/s**	19 Bit + 16 Bit, 2 Hz
Pulse	8 Bit/s	32 Bit/s	**16 Bit/s**	8 Bit, 2 Hz
EKG	800 Bit/s	96 000 Bit/s	**8 400 Bit/s**	14 Bit, 200 Hz, 3 Channel

- INGA Wireless Sensor Node
  - Designed for human activity monitoring
  - IEEE 802.15.4 radio interface
  - Micro-SD card slot
  - **50 kBit/s DTN application layer throughput**

Benefit: Implicit Synchronization

Storage fills when disruption occurs

- $S_{fill} = t_{disrupt} \cdot D_{gen}$

Synchronization time depends on fill level and data rates

- $t_{sync} = \frac{S_{fill}}{D_{good} - D_{gen}}$

Assumptions

- Accelerometer
  - 3 axis, 50 Hz, 10 Bit
  - → 1500 Bit/s
- IEEE802.15.4 radio
  - DTN implementation on INGA
  - →50 KBit/s DTN goodput

$t_{disrupt}$	t_{sync}	S_{fill}
1 second	0.03 seconds	< 200 Byte
1 minute	1.86 seconds	< 12 KByte
1 hour	< 2 minutes	< 1 MByte
1 day	< 45 minutes	< 17 MByte
1 month	< 5.2 hours	< 500 MByte
1 year	< 11.5 days	< 6 GByte

General Solution

Special solution

- $S_{fill} = t_{disrupt} \cdot D_{gen}$
- $t_{sync} = \frac{S_{fill}}{D_{good} - D_{gen}}$

Combine

- $t_{sync} = \frac{t_{disrupt} \cdot D_{gen}}{D_{good} - D_{gen}}$

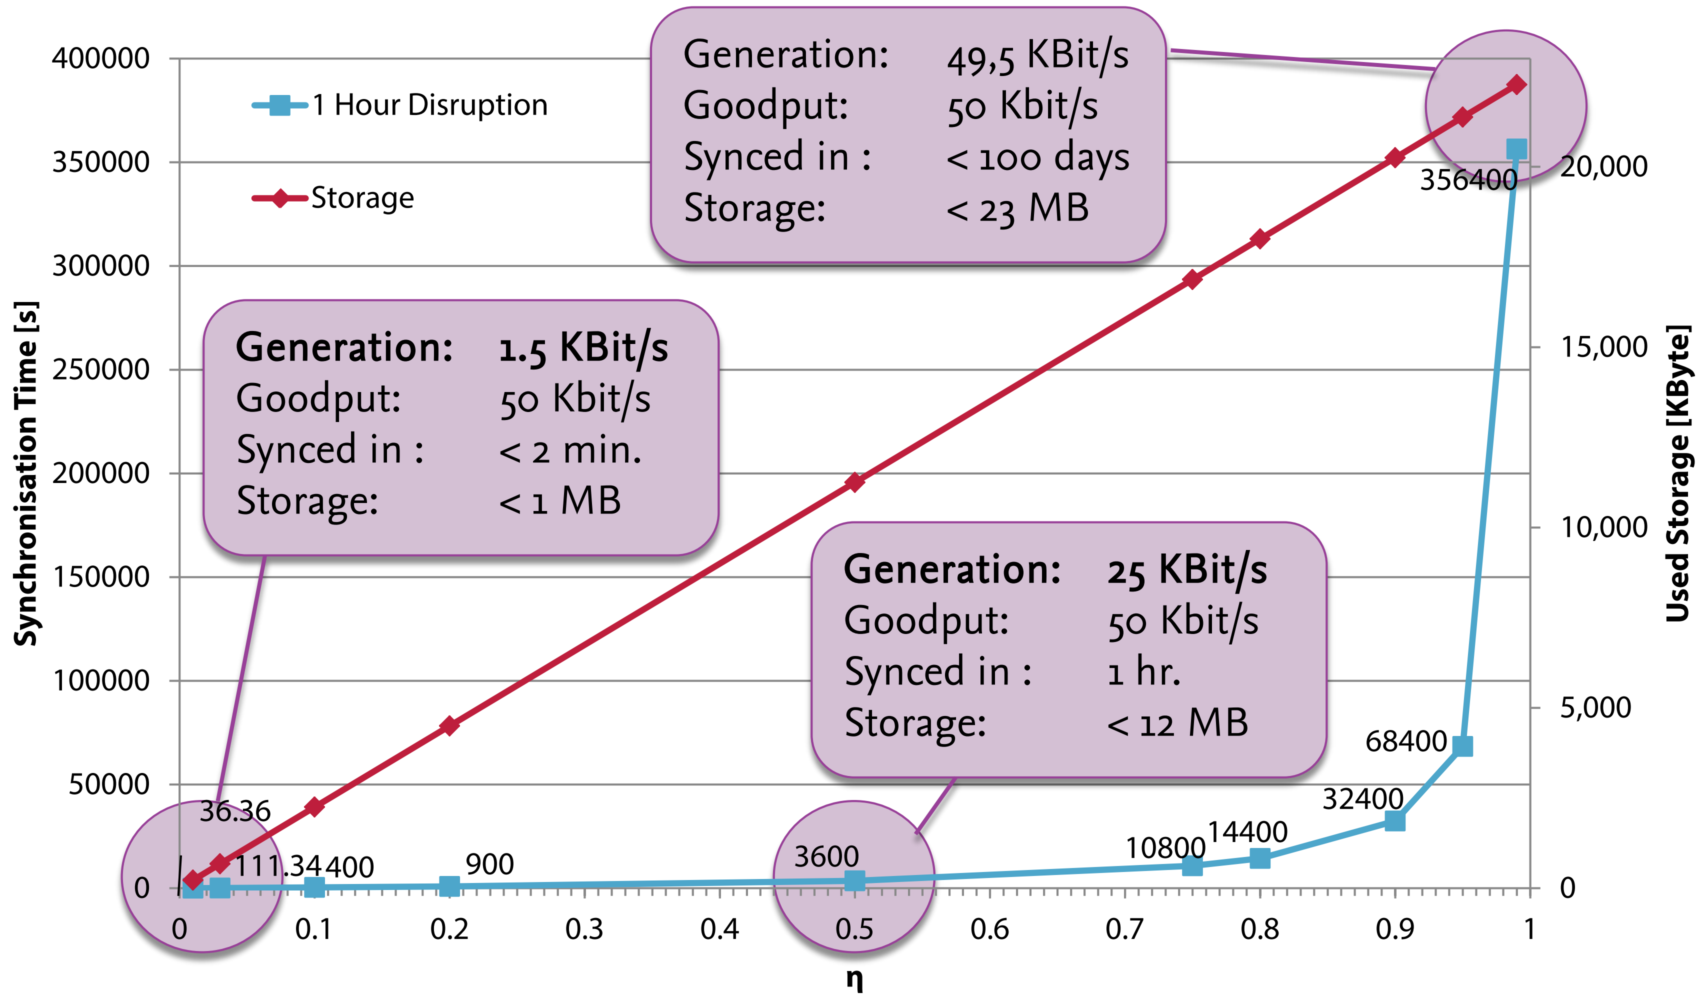
Substitute

- $\eta = \frac{D_{gen}}{D_{good}}$
- $t_{sync} = \frac{\eta \cdot t_{disrupt}}{1 - \eta}$

Synchronization time depends

- Duration of Disruption
- Ratio
  - Generated data
  - Throughput

Synchronization after 1 Hour Disruption, different η



Conclusion

Similar requirements in space and healthcare

- Demand of robust and reliable communication
  - Handle delays and disruptions
- Use standards, wherever applicable
  - DTN & Bundle Protocol at least “RFC-Status”

Use DTNs in long term monitoring applications!

- … if throughput > generated data

Thanks for your attention!
