

## Amphisbaena: A Two-Platform DTN Node

Stephan Rottmann, Robert Hartung, Jan Käberich, Lars Wolf, October 13, 2016

Institute of Operating Systems and Computer Networks

# Use Case

## Scenario

- Battery-powered node outdoors
- Several MB of data per day on SD card
- At unknown time, tractor arrives for short contact to collect data via DTN

# Use Case

## Scenario

- Battery-powered node outdoors
- Several MB of data per day on SD card
- At unknown time, tractor arrives for short contact to collect data via DTN

## Two-Platform Approach

- Low-power Board, 32 Bit MCU
  - IEEE 802.15.4
- *Raspberry Pi* Single-Board Computer
  - Wireless LAN

# Use Case

## Scenario

- Battery-powered node outdoors
- Several MB of data per day on SD card
- At unknown time, tractor arrives for short contact to collect data via DTN

## Two-Platform Approach

- Low-power Board, 32 Bit MCU
  - IEEE 802.15.4
- *Raspberry Pi* Single-Board Computer
  - Wireless LAN
- **SBC only powered up when needed**

# System Architecture

# System Architecture

# System Architecture

# System Architecture

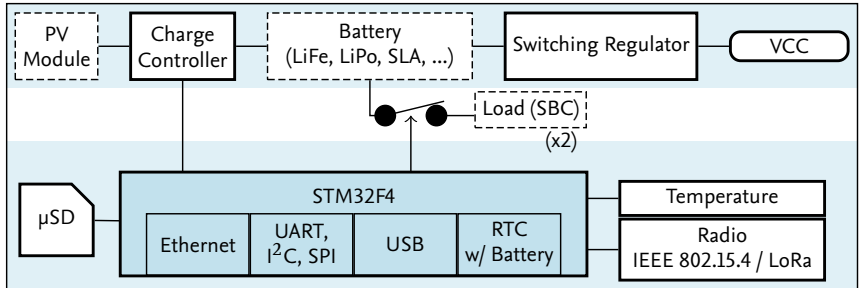

# System Architecture

# System Architecture

# Hardware Details

# Bundle Protocol

- Overlay network
- **Delay/Disruption Tolerant Network**
- Multiple network/transport layers supported at single node
- RFC4838, RFC5050

# Communication Aspects

## Two Platforms

- Both platforms are running a DTN stack
  - *miniDTN* on MCU platform
  - *IBR-DTN* on Raspberry Pi
- Communication stacks compatible to each other

# Communication Aspects

## Two Platforms

- Both platforms are running a DTN stack
  - miniDTN* on MCU platform
  - IBR-DTN* on Raspberry Pi
- Communication stacks compatible to each other
- Both appear as single node**

DTN Neighbors		
Protocol	State	Address
ipn:130.o	discovered	ip=fe80::7650:fb7d:7b4c:a76f%wlan0;port=4556;
DGRAM:UDP	discovered	addr=130;pan=1920;
DGRAM:LOWPAN	discovered	addr=130;pan=1920;
ipn:1466.o	discovered	addr=1466;pan=1920;
DGRAM:LOWPAN	discovered	addr=1466;pan=1920;

Two-Platform Node

miniDTN

IBR-DTN

# Use Case: Client sends all Bundles to ipn:130 (1)

# Use Case: Client sends all Bundles to ipn:130 (2)

# Use Case: Client sends all Bundles to ipn:130 (3)

# Other Options

## Applications Besides (*inter*)active Scenarios

- “Typical” DTN scenarios:
  - Disasters, after which infrastructure is broken
  - Battlefield communications
  - Simple relay node
    - Large data transfers via IEEE 802.15.4, interrupted and resumed via WiFi
- Bringing kind of Internet to rural areas
  - Ferry node (bus, boat, drone, ...)
    - Checks, if data is available and Raspberry Pi should be powered up
- For short-term operation, energy harvesting not necessary

# Other Options

## Applications Besides (*inter*)active Scenarios

- “Typical” DTN scenarios:
  - Disasters, after which infrastructure is broken
  - Battlefield communications
  - Simple relay node
    - Large data transfers via IEEE 802.15.4, interrupted and resumed via WiFi
- Bringing kind of Internet to rural areas
  - Ferry node (bus, boat, drone, ...)
    - Checks, if data is available and Raspberry Pi should be powered up
- For short-term operation, energy harvesting not necessary

**Beneficial in every scenario where whole processing or communication power is not needed continuously**

# Evaluation: Protocol

## Query-Response Protocol

- Different sizes of data
- Small request, large response
  - Take a picture
- Large request, small response
  - E.g., transfer new software to station
  - Store-and-Forward approach:
    - Store data for other node temporarily

# Evaluation: Protocol

## Query-Response Protocol

- Different sizes of data
- Small request, large response
  - Take a picture
- Large request, small response
  - E.g., transfer new software to station
  - Store-and-Forward approach:
    - Store data for other node temporarily

## Large Data transfers

- Collect sensor data from the day

# Evaluation: Setup

## Measurement Setup

- Setup similar as in Demo yesterday
- Energy measurements
  - Current and voltage
  - 100 kHz sample rate
  - *Markers* for synchronization

# Evaluation: Protocol

## Timing

- $T_0$ : *Amphisbaena* prepares Query
- $T_1$ : Query is being sent on wire
- $T_2$ : Response from *IBR-DTN* ack'd
- $T_3$ : Transfer finished

# Evaluation

## Optimization Goals

- Energy demand and time depend on...
  - Communication Interface
    - IEEE 802.15.4, Ethernet, WLAN
  - CPU clock
- **Both have influence on time needed for transmission**
- **Both have influence on energy needed for transmission**
- What should be optimized, energy **OR** time?

$$C(s_{tx}, s_{rx}, M_i, f_{CPUj}) = (E, T)(s_{tx}, s_{rx}, M_i, f_{CPUj})$$

$s_{tx}, s_{rx}$ : Size of data to be sent/received

$M_i$ : Communication medium (Ethernet, IEEE 802.15.4)

$f_{CPUj}$ : Clock frequency of CPU

# Parameters for Evaluation

## Communication Interfaces

- IEEE 802.15.4
- WLAN (from Linux Board)
- (Ethernet)

# Parameters for Evaluation

## Communication Interfaces

- IEEE 802.15.4
- WLAN (from Linux Board)
- (Ethernet)

## Clock frequencies $f_{CPU}$

- 24 MHz
- 30 MHz
- 80 MHz
- 144 MHz

# Parameters for Evaluation

## Communication Interfaces

- IEEE 802.15.4
- WLAN (from Linux Board)
- (Ethernet)

## Bundle Sizes

- 64 Byte and 1024 Byte in any combination for  $s_{tx}$  and  $s_{rx}$

## Clock frequencies $f_{CPU}$

- 24 MHz
- 30 MHz
- 80 MHz
- 144 MHz

# Parameters for Evaluation

## Communication Interfaces

- IEEE 802.15.4
- WLAN (from Linux Board)
- (Ethernet)

## Clock frequencies $f_{CPU}$

- 24 MHz
- 30 MHz
- 80 MHz
- 144 MHz

## Bundle Sizes

- 64 Byte and 1024 Byte in any combination for  $s_{tx}$  and  $s_{rx}$

## Communication Partner

- *Amphisbaena*
- *IBR-DTN* running on Raspberry Pi
- (*IBR-DTN* running on Intel Core i7-3770 based Computer)

# Results: Small Bundles via IEEE 802.15.4

# Results: Small Bundles via IEEE 802.15.4

## Transfer of 64 ↔ 64 Bytes to Raspberry Pi

## Transfer of 64 ↔ 64 Bytes to Amphisbaena

# Findings

- **Small Bundles via IEEE 802.15.4**
  - Increasing  $f_{CPU}$  not useful when communicating with RPi

# Results: Large Bundles via IEEE 802.15.4

# Findings

- Small Bundles via IEEE 802.15.4
  - Increasing  $f_{CPU}$  not useful when communicating with RPi
- **Optimum may not be at bounds of parameters**

# Results: Many large Bundles in a Row

## Transfer via IEEE 802.15.4 vs. WLAN (Data shown per Bundle)

# Results: Many large Bundles in a Row

## Transfer via IEEE 802.15.4 vs. WLAN (Data shown per Bundle)

SBC Type	Medium	Boot-Time	Energy
Raspberry Pi Mod B <sup>1</sup>	WLAN	<sup>†</sup> 103.23 s	203.963 Ws
Raspberry Pi2 Mod B <sup>2</sup>	WLAN	24.1 s	30.157 Ws

<sup>1</sup> Running Raspbian *wheezy* // <sup>2</sup> Running Raspbian *jessie* // <sup>†</sup> Association with WLAN AP may take very long

# Findings

- Small Bundles via IEEE 802.15.4
  - Increasing  $f_{CPU}$  not useful when communicating with RPi
- Optimum may not be at bounds of parameters
- **Large differences in speed between WLAN and IEEE 802.15.4**
  - **But: Booting costs energy, too!**

# Conclusions

- Two-Platform DTN node
  - MCU-based board, Raspberry Pi
- Both parts appear as a single node
- Energy demand depends on
  - Communication medium
  - Communication partner
  - Clock frequency
- Large delays for *IBR-DTN* on platforms like Raspberry Pi
- Tradeoff between energy demand and time has to be found

# Conclusions

- Two-Platform DTN node
  - MCU-based board, Raspberry Pi
- Both parts appear as a single node
- Energy demand depends on
  - Communication medium
  - Communication partner
  - Clock frequency
- Large delays for *IBR-DTN* on platforms like Raspberry Pi
- Tradeoff between energy demand and time has to be found

**Thank you! Any Questions?**  
[rottmann@ibr.cs.tu-bs.de](mailto:rottmann@ibr.cs.tu-bs.de)

In Greek mythology, Amphisbaena is a serpent with two heads.

# Results: Large Bundles via Ethernet

## Transfer of 1024 ↔ 1024 Bytes to Raspberry Pi

## Transfer of 1024 ↔ 1024 Bytes to Intel Core i7

# Findings

- Small Bundles via IEEE 802.15.4
  - Increasing  $f_{CPU}$  not useful when communicating with RPi
- Optimum may not be at extrema of parameters
- **Ethernet**
  - **Strongly dependent on Communication Partner**
  - **Large delays on Raspberry Pi  $\rightarrow$  low  $f_{CPU}$**

# Cooperation

## Cooperation of DTN implementations

- DTN stacks know of each others applications
- If a bundle for the other one is received, it will be forwarded
  - Linux platform may be powered up
- *Amphisbaena* may decide to boot Linux if bundle is too big
- Cooperation is transparent to neighbors
- Information is exchanged via USB between *miniDTN* and *IBR-DTN*

# Power Supply

- Efficient Switching Regulator *LM43603*
  - Provides 3.3 V
- Charge Controller *LT3652HV*
  - Charges Li-Ion/LiPo/LiFePO<sub>4</sub> /Lead-Acid
- Photovoltaic Module

# Processing Unit

- STM32F407VGT MCU
  - Ethernet, USB
  - SD Card
  - I<sup>2</sup>C, SPI, UART, ...
  - RTC with Backup-Battery
- Two Outputs for Load
  - MOSFET High Side Switches
- Low Power Radio
  - IEEE 802.15.4
  - LoRa
- 1-wire Temperature Sensors *DS18B20*
